

SFWRTECH 4WP3

Advanced Web Programming

Project Milestones #1

McMaster University: B-tech

Course: SFWRTECH 4WP3 – Advanced Web Programming

Student ID: 400549296

Student name: Sungsu Kim

Professor: Kevin Browne

1. Purpose

The Student Course Planner serves as a centralized dashboard for university students to organize their schedule for a semester. It allows students to track which courses should take for graduation based on their specific program requirements, helping them visualize both their current workload and their overall progress toward their degree.

2. Potential User

The primary potential use would be university or college student who can keep a digital log of their current and planned subjects for the graduation. In addition, the academic advisor also can use to help students visualize their workload and schedule gaps.

3. 8 actions

1. View all course: the main dashboard displaying the list of all saved courses.
2. Filter by availability: an action to filter the view to show availability or course at a semester.
3. sort by level of course: based on the level of course (level 3->level4 or semester 1->semester 4) ordered the course
4. View course detail: a detail page showing short description of course and details of course (e.g. professor name, prerequisites, date, time, online or in-person).
5. Add course: open a form that user can add course to the table.
6. Save new course: the post action that saves the course details to the SQLite database.
7. Update course: The action saves changes (e.g., changing the course time or availability).
8. Drop course: an action to remove a course from the database.

4. Responsive Changes (at 768px)

- Sidebar to Header: On desktops, a sidebar menu exists, on mobile, it collapses into a top-level navigation bar.
- Font Scaling: The main page tile size will decrease to prevent text wrapping and save screen real estate.
- Form layout adjustment: The "Add Course" form will transition into vertical stack. This ensure all input fields are full width.

5. SQLite Database column

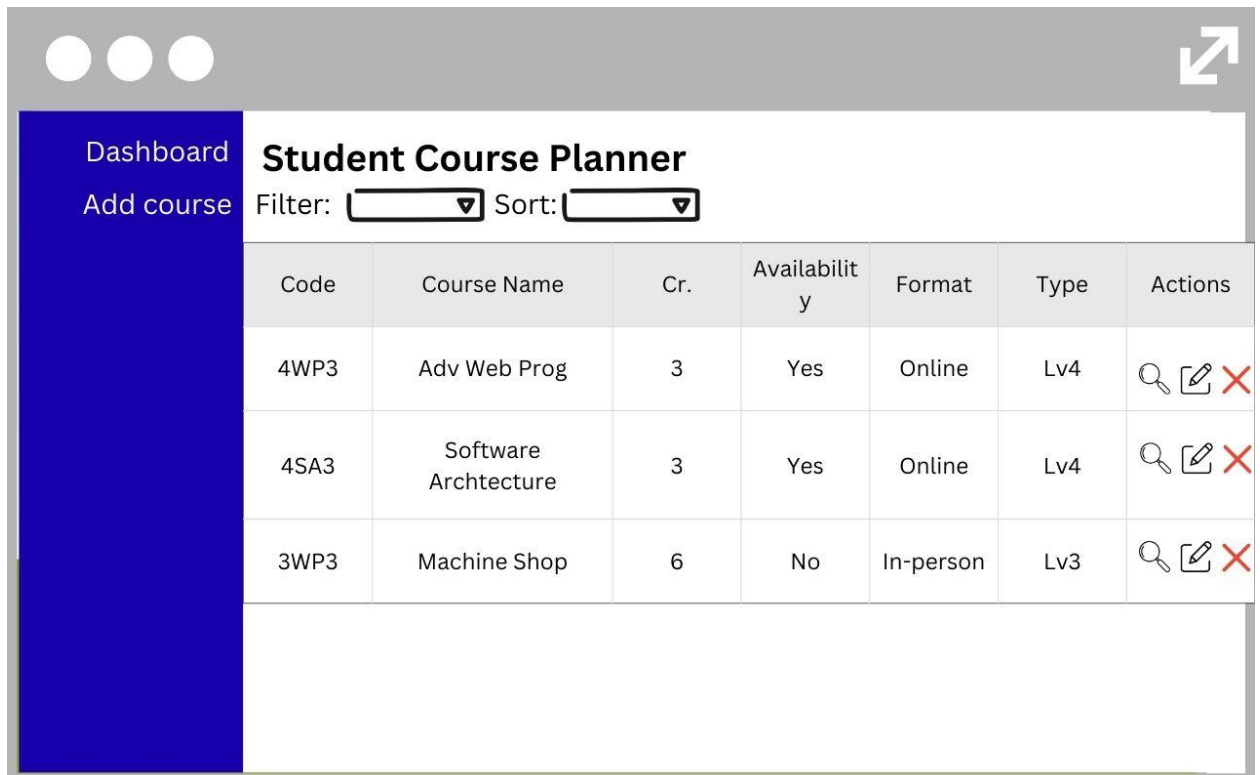

- Course Code: The code for registering (e.g., "4WP3")
- Course Name: Name of the course (e.g., "Advanced Web Programming")
- Credit: The Number of credit hours.

- Availability: The availability of course.
- Format: Choice of “online” or “In-person”.
- Course Type: Elective or level of course (e.g., Level 3, Level 4)

6. Validation

validate the input of credit that must be a number (Real) and must be between (0.5~6.0) and course code must be a String and not exceed 10 characters

7. UI prototype of application
